Communicable Disease Control in Emergencies May 24 2022 This field manual is intended to help health professionals and public health coordinators working in emergency situations prevent, detect and control the major communicable diseases encountered by affected populations. The manual is the result of collaboration among a number of WHO departments and several external partner agencies in reviewing existing guidelines on communicable disease control and adapting them to emergency situations. The manual deals with the fundamental principles of communicable disease control in emergencies, which are: Rapid assessment to identify the communicable disease threats faced by the emergency-affected population, including those with epidemic potential, and define the health status of the population by conducting a rapid

assessment; Prevention to prevent communicable disease by maintaining a healthy physical environment and good general living conditions; Surveillance to set up or strengthen disease surveillance system with an early warning mechanism to ensure the early reporting of cases to monitor disease trends, and to facilitate prompt detection and response to outbreaks; outbreak control to ensure outbreaks are rapidly detected and controlled through adequate preparedness (i.e. stockpiles, standard treatment protocols and staff training) and rapid response (i.e. confirmation, investigation and implementation of control measures); and disease management to diagnose and treat cases promptly with trained staff using effective treatment and standard protocols at all health facilities.

Non-Communicable Disease Prevention: Best Buys, Wasted Buys and Contestable Buys Jun 24 2022 Non-communicable diseases (NCDs) are the leading cause of death worldwide, contributing to over 73% of all deaths annually. Each day NCDs cause more than 100,000 deaths, 80% of which occur in low- and middle-income countries. NCDs, however, are largely preventable, and a great deal of technical knowledge exists about how to prevent and manage them. Why, then, have we, as a global community, not been more successful at reducing this NCD burden? Does a universal problem not have a universal solution? Created by an international consortium of experts, this informative and accessible book provides practical guidelines, key learning points, and

dynamic, real-world case studies to aid NCD program managers, policy officers and decision-makers in low- and middle-income countries, so that they can assess interventions for the prevention and control of NCDs. The book was commissioned by the Prince Mahidol Award Conference (PMAC), an annual international conference centred on policy of global significance related to public health. *Non-Communicable Disease Prevention: Best Buys, Wasted Buys and Contestable Buys* emphasises the importance of context in NCD control and prevention, arguing that the success of an intervention lies in an ability to respond to local needs and environments. The book comprises ten chapters, which collectively explore the reasons behind, and strategies for, preventing and managing the NCD burden. It spans key themes such as political economy, the transferability of economic evidence, the role of cross-sectoral policies, the importance of deliberative processes, and health technology assessment. This book is written for the benefit of the global health community, and is primarily targeted at those individuals who are involved in NCD programs. This book will also be of interest to NCD champions, policy advocates, and educators spearheading the movement for increased visibility of NCDs.

Zoonoses and Communicable Diseases Common to Man and Animals Apr 22 2022 In recent years, zoonoses and communicable diseases common to man and animals have gained increasing attention worldwide. Human diseases that have their origins in infected animals, such as AIDS or Creutzfeldt-Jakob, have highlighted the need for a better understanding of animal diseases in terms of their epidemiology, mechanism of transmission to man, diagnosis, prevention and control. Encroachment into formerly little known ecological areas has increased exposure to such diseases. Also, the speed of modern travel facilitates the spread of the diseases once confined to specific geographic areas. Animal migration and trade pose a similar threat. This new edition provides a detailed overview of the most important zoonotic diseases including: its first appearance, most important outbreaks, latest scientific knowledge, and causative agents. It includes etiology, geographic distribution, symptoms and occurrence in man and animals, source of infection, mode of transmission, role of animals in the epidemiology of the disease, diagnostic techniques and prevention and control measures; name and number according to the International Statistical Classification of Diseases and Related Health Problems (ICD -10.). It also includes an index covering synonyms and etiologic agents' names.

**Emerging Communicable Diseases: Ebola** Apr 30 2020 Academic Paper from the year 2018 in the subject Health - Miscellaneous, grade: na, University of Western Sydney, language: English, abstract: Infectious diseases are a constant threat to human life. Various scientific research findings since the 19th century have, however, paved the way for an improved comprehension of infectious diseases with regards to their natural history and the preventive measures to control them. These measures include vector control, immunisation, and water treatment. The implementation of these

measures over the last century brought about huge victories for mankind in the battle to control infectious diseases. A good example of such victories is the eradication of smallpox in the year 1979. In recent decades nonetheless, the incidence of infectious diseases which were thought to be well controlled has increased in several locations across the world. Antimicrobial resistance is also on the rise globally and diseases which were previously unknown to man have also emerged. These issues have become global problems which require urgent assessment and resolution. This essay is an in-depth critical review of the literature on Ebola, one of the emerging communicable diseases. The essay will discuss the concept of disease emergence, provide a brief history about the Ebola virus, review the factors that have contributed to the emergence of Ebola infection, discuss some of the current policies to control this disease and make recommendations on strategies to improve on the current Ebola control policies.

Global Handbook on Noncommunicable Diseases and Health Promotion Jan 26 2020  
Global Handbook on Noncommunicable Diseases and Health Promotion David V. McQueen, editor A scan of health challenges around the globe readily brings to mind a range of infectious illnesses, from HIV to influenza. Yet chronic non-contagious conditions--heart disease, asthma, diabetes, cancer--are more prevalent, and their rates soaring, across the developed and developing worlds. The Global Handbook on Noncommunicable Diseases and Health Promotion is an important resource for understanding and approaching chronic illnesses and their prevention. This timely text balances theory and strategies to provide an integrative context for health-affecting behaviors regarding tobacco use, food choices, and physical activity. Coverage expands

on current medical/clinical public health perspectives, arguing that closer attention to social context is crucial to better use of health resources and more relevant preventive efforts. Possible roles for hospitals, the workplace, government agencies, NGOs, and other institutions are analyzed, as is the potential for addressing larger underlying health factors (e.g., inequities and poverty) at the societal level. Topics covered include: The nature of causality: beyond traditional evidence Learning from the social sciences in chronic disease health promotion Contextual factors in health and illness Understanding and applying a social determinants of health framework for addressing NCDs Public health, NCDs, health promotion and business partnering NCDs and civil society: a history and a roadmap As the authors of the Global Handbook on Noncommunicable Diseases and Health Promotion make abundantly clear, opportunities are as numerous as the issues, and researchers and graduate students in global public health, health promotion, and chronic disease epidemiology will find these chapters positive and realistic.p>

An Introduction to Population-Level Prevention of Non-Communicable Diseases Sep 03 2020 Non-communicable diseases (NCDs) are the single biggest cause of death in the world. They include cardiovascular diseases, such as heart attacks and stroke, cancers, chronic respiratory diseases, like chronic obstructed pulmonary disease and asthma, and diabetes. The World Health Organization published a 'Global Action Plan for the prevention and control of NCDs 2013-2020' which set a target to reduce death rates from NCDs by 25%. In response, countries are drawing up national level NCD prevention policies and programmes. New units have been set by governments, NGOs, and other organisation to drive this agenda forward creating a need for capacity building and training. Until the Nuffield Department for Population Health at the University of Oxford initiated an accredited six-day short course on Prevention Strategies for Non-Communicable Diseases with a population-based approach, many attempts to engage with NCD prevention centred on individual-level interventions,

such as screening and treating individual patients. In this new book, the course leaders bring together the entire scope of the population-based approach and provide a solid introduction to the concepts, evidence, and methods that define it. 'An Introduction to Population-Level Prevention of Non-Communicable Diseases' takes readers through the policy cycle from problem definition, solution generation, capacity building, and implementation to evaluation and monitoring. The book includes a wide range of case studies, and practical examples of plans and projects which illustrate real-life application of theory. This book provides an unparalleled overview of population-based approaches to the prevention of non-communicable diseases, reflecting the latest research in the field. It will be a key resource for anyone with an interest in NCD prevention, with particular relevance to early-career professionals working on NCD prevention in governments, NGOs, health care institutions, and universities, as they develop the knowledge and skills required for effective population-based prevention strategies.

**EBOOK: Applied Communicable Disease Control** Aug 15 2021 Understanding Public Health is an innovative series published by Open University Press in collaboration with the London School of Hygiene & Tropical Medicine, where it is used as a key learning resource for postgraduate programmes. It provides self-directed learning covering the major issues in public health affecting low-, middle- and high-income countries. Communicable diseases are ever present in the world today. Social and economic issues like poverty, access to essential vaccinations and lack of substantive healthcare systems contribute to mortality rates alongside epidemiological factors like portals of entry and bacterial sources. This public health textbook, in exploring the causes and conditions of communicable diseases like Ebola and malaria, clearly outlines communicable disease control and prevention measures as well as how to apply these measures effectively in different contexts and populations around the world. The result is an engaging and insightful textbook that encourages readers to apply their learning of communicable disease control to diverse applied settings through case studies and activities. It is balanced in its approach, discussing infections and their incidence alongside the means of prevention and the vital conditions for effective response in outbreak situations. Applied Communicable Disease Control is key reading for all those working in, or studying, public health and epidemiology. Series Editors: Rosalind Plowman and Nicki Thorogood.

Section One highlights the critical role surveillance plays in public health and it provides an overview of the current International Health Regulations (2005) in addition to successes and challenges in infectious disease eradication. Section Two describes surveillance systems based on logical program areas such as foodborne illnesses, vector-borne diseases, sexually transmitted diseases, viral hepatitis healthcare and transplantation associated infections. Attention is devoted to programs for monitoring unexplained deaths, agents of bioterrorism, mass gatherings, and disease associated with international travel. Sections Three and Four explore the uses of the Internet and wireless technologies to advance infectious disease surveillance in various settings with emphasis on best practices based on deployed systems. *Tuberculosis and Air Travel* Dec 27 2019 The revised International Health Regulations, adopted in 2005, provide a legal framework for a more effective coordinated international response to emergencies caused by outbreaks of infectious diseases. A number of provisions are relevant to the detection and control of TB during air travel, strengthening the authority of WHO and of national public health authorities in this domain. Because of these important developments since the original guidelines were issued in 1998, WHO has prepared this revised version to take account of current public health risks that may arise during air travel and new approaches to international collaboration in dealing with them. The guidelines were developed with the collaboration of international experts in air travel medicine and other authorities. Implementing the recommendations will help to reduce the spread of dangerous pathogens across the globe and decrease the risk of infection among individual travellers.--Publisher's description.
