The Mark II Red and Blue Agent Control Systems for the Rand Strategy Assessment Center Feb 18 2022 This Note describes the second-generation 'Mark II' version of the Rand

Strategy Assessment Center's Red and Blue Agents. These agents are models representing the behavior of the Soviet Union and the United States in an automated political-military game. The Note documents the technical features of the Mark II Red and Blue Agent models; provides a User's Manual; describes model

operations with an example from a typical RSAC war game; and explains the relationships between Mark I, II, and III systems. The Note is predominantly technical, and has more to say about the structure of the models than about their basis in political or military science or about the rationale for the variables used or excluded in Mark II analysis. Exploring the Early Digital Jan 08 2021

Changes in the present challenge us to reinterpret the past, but historians have not yet come to grips with the convergence of computing, media, and communications technology. Today these things are inextricably intertwined, in technologies such as the smartphone and internet, in convergent industries, and in social practices. Yet they remain three distinct historical subfields, tilled by different groups of scholars using different tools. We often call this conglomeration “the digital,” recognizing its deep connection to the technology of digital computing. Unfortunately, interdisciplinary studies of digital practices, digital methods, or digital humanities have rarely been informed by deep engagement with

the history of computing. Contributors to this volume have come together to reexamine an apparently familiar era in the history of computing through new lenses, exploring early digital computing and engineering practice as digital phenomena rather than as engines of mathematics and logic. Most focus on the period 1945 to 1960, the era in which the first electronic digital computers were created and the computer industry began to develop. Because digitality is first and foremost a way of reading objects and encoding information within them, we are foregrounding topics that have until now been viewed as peripheral in the history of computing: betting odds calculators, card file systems, program and data storage, programmable calculators, and digital circuit design practices. Reconceptualizing the “history of computing” as study of the “early digital” decenters the stored program computer, repositioning it as one of many digital technologies.

[Birthing the Computer](#) Jul 14 2021 Birthing the Computer: From Relays to Vacuum Tubes is the first in a multi-volume series on historical computing machines. This series will span the development of computer systems from the Zuse machines of the early 1930s to about 1995 when microprocessors began to be commoditized. Each volume will focus on a range of technologies, or a class of machines or a particular vendor, and will describe the hardware of the machines and its peripherals, the operating system and system software, and its influence upon programming languages. This volume begins with the Zuse machines which were constructed from relays, but contained the

basic elements of a computer system, namely input, computing engine, and output. Early machines from Atanasoff and Berry, Aiken, Stibitz, and IBM are described. The transition from relays to vacuum tubes increased speed and performance significantly, and led to the first true computers in ENIAC, EDSAC, and EDVAC which used paper tape and Williams tubes for I/O and storage. These machines were built by universities. Several early machines were purpose built such as Colossus and BINAC, and created with government support and industrial know-how. By the mid-to-late '50s, computing machines were being built by universities (the SSEM, Whirlwind, and IAS machines), governments (the NBS SEAC and SWAC, and several other machines), and industry (the UNIVAC series and the English Electric DEUCE). Most of these machines were constructed using the von Neumann architecture, and represent an evolution of thinking in how computing machines were to

operate along with some innovative ideas in software and programming languages. By the end of the 1950s, the design, development, programming and use of computing machines were in full ferment as many new ideas were proposed, many different machines were designed and some were constructed.

Computing machines became a commercial enterprise. Governments receded from building machines to levying requirements and funding construction, while universities continued to explore new architectures, new operating systems, and new programming languages.

Ford Escort and Cortina Mk I and Mk II Oct 17

2021 Ford Cortina and Escort Mk I and Mk II models brought family motoring to millions of people from the early 1960s. These Fords were straightforward, easy to drive and simple to maintain, and their popularity has been sustained largely because of this. Their basic simplicity of design and inherent ruggedness means that they are ideal candidates for DIY restoration. The booming owners' club movement and the continuing availability of spare parts ensures that these cars will have a strong following for many years to come.

Makin' Numbers Jun 12 2021 with the cooperation of Robert V. D. Campbell This collection of technical essays and reminiscences is a companion volume to I. Bernard Cohen's biography, Howard Aiken: Portrait of a Computer Pioneer. After an overview by Cohen, Part I presents the first complete publication of Aiken's 1937 proposal for an automatic calculating machine, which was later realized as the Mark I, as well as recollections of Aiken's first two machines by the chief engineer in charge of construction of Mark II, Robert Campbell, and the principal programmer of Mark I, Richard Bloch. Henry Tropp describes Aiken's hostility to the exclusive use of binary numbers in computational systems and his alternative approach. Part II contains essays on Aiken's administrative and teaching styles by former students Frederick Brooks and Peter Calingaert and an essay by Gregory Welch on the difficulties Aiken faced in establishing a computer science program at Harvard. Part III

contains recollections by people who worked or studied with Aiken, including Richard Bloch, Grace Hopper, Anthony Oettinger, and Maurice Wilkes. Henry Tropp provides excerpts from an interview conducted just before Aiken's death. Part IV gathers the most significant of Aiken's own writings. The appendixes give the specs of Aiken's machines and list his doctoral students and the topics of their dissertations.
